

January, 1991

Dear LightningScan GS and LightningScan GS/LC owners,

Enclosed is a complementary software upgrade to LightningScan. Disk version 2.1 of LightningScan GS includes several items:

- **Version 1.2 of LightningScan GS.** Several new features suggested by our users have been added including the Histogram and Color Filter. A few bugs have been fixed too.
- **Version 1.2 of the LightningScan GS new desk accessory (NDA).** The NDA lets you scan from within other applications. This new version of the NDA creates smaller images in the line art mode. The NDA has all the features of version 1.0 of the LightningScan GS application and has the added convenience of letting you scan, copy and save from within any GS/OS application. The LightningScan GS NDA requires GS/OS and at least 1.125 megabytes to run, but more memory is recommended for best performance.
- **GS/OS 5.0.2 with the Finder.**
- **Version 1.2 of the ThunderScan application.**
- **The New Features Update** which explains how to use the NDA (if your version of LightningScan did not come with it).
- **Version 1.2 NDA update** sheet that explains the latest features of the NDA not explained in the New Features Update.

To start your system with this new disk, your IIGs needs at least 1.125 megabytes of RAM. If you have less RAM, you need to run LightningScan under ProDOS 16 instead of GS/OS. Thunderware will send you a ProDOS 16 disk at no charge. Simply return the enclosed disk back to us with a note requesting it.

Thank you for your continued support!

Sincerely,

Cindy Gebelein
Sales Manager
